

FRAME ADJUSTING BLOCKS.

SECURE SUPPORT FOR HEAVY AND WIDE SASHES IN THE OUTER FRAME.

Frame adjusting blocks provide reliable support for wide and heavy sashes in the outer frame. They absorb loads in a controlled manner and permanently relieve hardware components and welding connectors.

The wedge-shaped plastic blocks are designed to match the respective outer frame profiles and are securely screwed into the frame, creating a stable and durable solution for long-term use.

Key advantages at a glance

- ✓ Secure support for wide and heavy sashes
- ✓ Reduces load on hardware components and welding connectors
- ✓ Permanent screw fixation in the outer frame
- ✓ Profile-matched geometry
- ✓ Dimensionally stable and highly load-resistant
- ✓ Simple and quick installation

Material & sustainability

Manufactured from high-quality polypropylene (PP).

The material is ageing-resistant, dimensionally stable and designed for long-term load capacity. It is fully compatible with PVC profiles and does not cause unwanted material interactions.

Typical applications in window manufacturing

- Support for entrance door sashes
- Stabilization of wide window sashes
- Use in elements with increased sash weight
- Additional measure to reduce load on hardware components

Installation

- Position the block in the lower outer frame
- Screw the block securely into the profile
- Permanent fixation ensures long-term stability

Compliance and quality

- Dimensionally stable and ageing-resistant
- Suitable for permanent load absorption
- Compatible with common PVC frame systems
